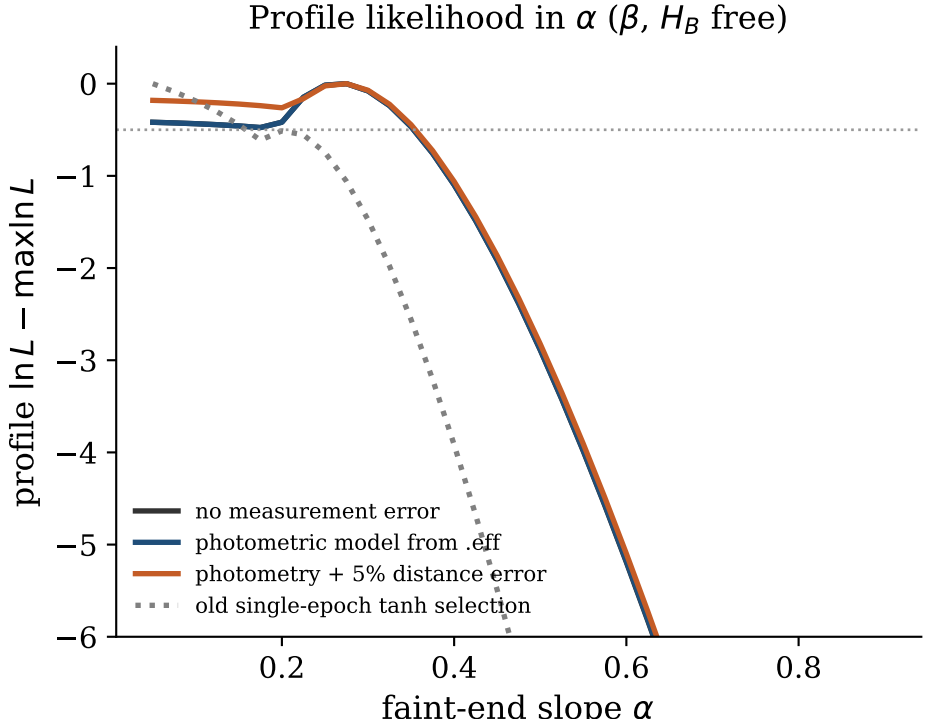
Predicted vs observed detections
Sample A cold ($n = 12$)
tapered MLE ($\alpha = 0.27$, $\beta = 2.00$, $H_B = 8.56$)
second ridge ($\alpha = 0.05$, $\beta = 0.12$, $H_B = 13.76$)
single exponential ($\alpha = 0.24$)
detections per 0.5 mag
H_r



Profile likelihood in α (β, H_B free)
profile $\ln L - \max \ln L$
faint-end slope α
no measurement error
photometric model from .eff
photometry + 5% distance error
old single-epoch tanh selection
